

**Simian-Human Immunodeficiency Virus Infectious Molecular Clone SHIV.B41.375H.dCT**
**Catalog No. HRP-20049**
**Product Description:**

HRP-20049 is a full-length molecular clone of infectious and replication-competent simian-human immunodeficiency provirus. This clone contains an amino acid residue at Env position 375 that supports virus entry and replication in primary rhesus CD4 T cells. SHIV.B41.375H.dCT is an isogenic mutant of SHIV.B41.375S.dCT generated by changing wildtype B41 Env375 residue (9032.08\_A1, GenBank: [MW410732](#)) from Ser to His. SHIV.B41.375H.dCT showed increased infectivity and replication kinetics *in vitro* in Indian rhesus macaque CD4<sup>+</sup> T cells and *in vivo* in Indian rhesus macaques. The plasmid encodes full-length, replication-competent SHIV in a [pCR-XL-TOPO](#) backbone. The kanamycin resistance gene, *aph*, provides transformant selection through kanamycin resistance in *Escherichia coli* (*E. coli*). The resulting size of the plasmid is approximately 13,930 base pairs. The purified plasmid DNA was provided vialled in TE buffer (10 mM Tris-HCl, 1 mM EDTA).
